

Part A: Steps for Contouring the Groundwater and drawing Isochron Plumes

Step 1: Plot the elevation of the groundwater table values from the table above on the map provided. Contour the groundwater table using **a 5' (five foot) contour interval** to create a groundwater flow net. Do this in pencil first and then when you have your final lines go over them in a thick blue pen.

Step 2: Plot the diesel plume thickness from the table above and contour the plume of diesel free product in **0.5' (half-foot) increments**. Do this in pencil first and then when you have your final lines go over them in a thick black pen.

3) What property is least contaminated and has the lowest environmental risk? Explain

4) The refinery's budget allows 4 new wells to be drilled. Where should they drill more monitoring wells and why? Explain. Mark the 4 new well locations on the map provided using 4Xs.

*5' contours for groundwater

*0.5 isochron contours pacing

1000ft

Well and number	Direct plane thickness	Groundwater elevation
12		
5' contour interval for groundwater elevation		
0.5' contour for direct thickness		
1000 feet
